

PORTRAIT SKIN REGENERATION (PSR)

Portrait Skin Regeneration At A Glance

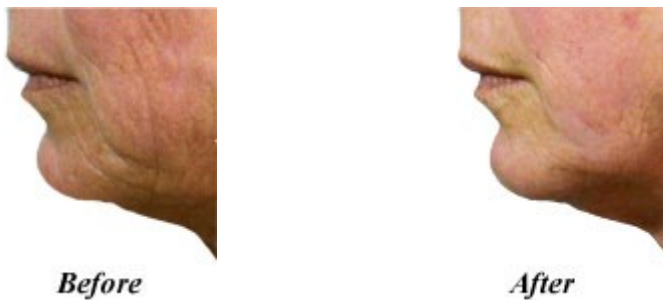

<i>Treatment for:</i>	Fine lines and discoloration from sun damage
<i>Expected Results:</i>	Smoother, tighter skin.
<i>Treatment Time:</i>	30 minutes to 90 minutes
<i>Recovery Time:</i>	4 to 7 days

Portrait Skin Regeneration (PSR) is a dramatic leap forward in the science of beauty and skin rejuvenation. It uses a new kind of energy delivered in the form of ionized nitrogen gas called plasma. Plasma energy stimulates the collagen and elastic tissue in the lower dermis to create healthier skin with continual aesthetic improvement.

Unlike the Thermage and Fraxel technologies, PSR takes only one to three treatments. There is less recovery time and it is less expensive compared to older technologies.

We offer PSR treatments in three different modalities, high energy, low energy and lite. High energy modality is given in one treatment, causes more tightening of the skin, and takes one week to heal. The low energy modality is given in three treatments, one month apart. This acts like a sunburn and is completely healed in four days. Lite energy is given in 3 to 6 treatments, 3 weeks apart. There is no downtime involved with the lite energy treatment.

Results are long-lasting.
