

GLYCOLIC ACID PEEL

For Acne

A glycolic acid peel helps treat acne pustules, blackheads and whiteheads. It is fast, painless, and a very cost effective way to treat acne. It is an important addition to the acne treatment done at home.

A thin layer of glycolic acid is applied to the face, chest or back, and left on the skin for one to two minutes before it is neutralized. Initially the procedure should be repeated every two weeks for about three months. After this period, the treatment may be performed once a month.

For Sun-Damaged Skin

A glycolic acid peel is very effective for the treatment of mild to moderate sun-induced damage of the face and hands, including fine wrinkles, irregular pigmentation and keratoses.

A thin layer of glycolic acid is applied to the face and hands, and left on the skin for one to two minutes before it is neutralized. For most optimal results, pretreatment of the skin with Retin-A is suggested.

Initially, the peels will be repeated every one to two weeks until the desired effects are attained. Following this period, maintenance treatments may be repeated every one to two months.
